PROJECT: GYM MEMBERSHIP MANAGEMENT SYSTEM
EXPERIMENT 7: ZOHO CREATOR API INTEGRATION

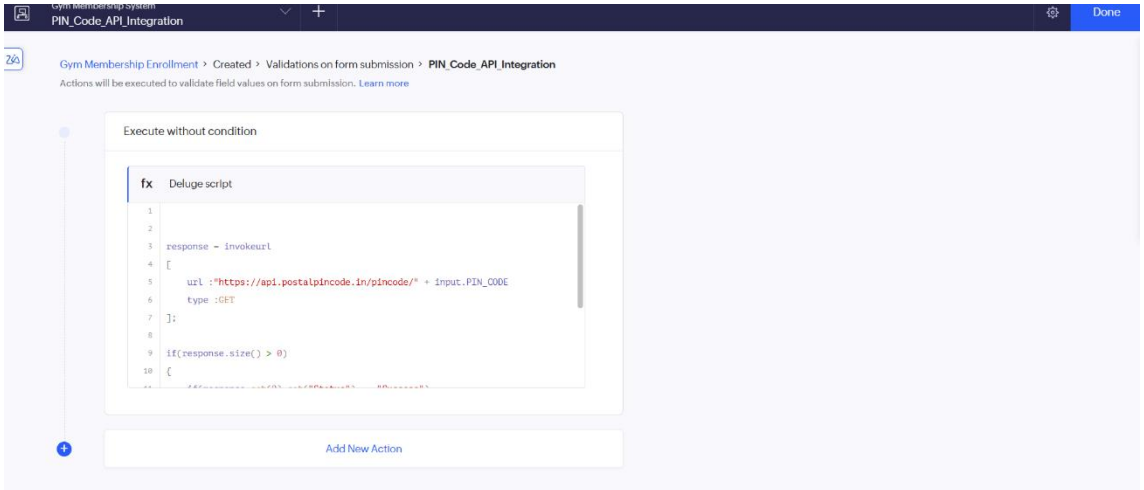

Aim

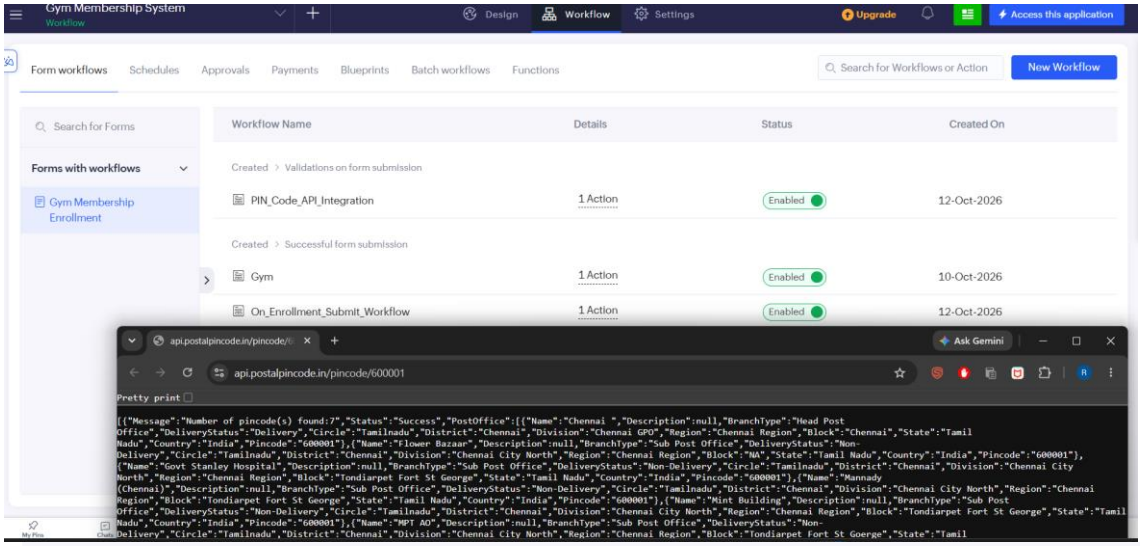

To integrate an external REST API with the Gym Membership Management System in Zoho Creator using Deluge scripting, retrieve district and state details from a member's PIN code, and demonstrate communication between Zoho Creator and an external service.

Procedure

1. Log in to Zoho Creator and open the Gym Membership Management System application.
2. Open the existing Gym Membership Enrollment form in the form editor.
3. Add three fields: **PIN Code, District, and State**, if they do not already exist.
4. Configure the field link names for the three fields.
5. Open the Workflows section and create a new workflow named PIN_Code_API_Integration.
6. Configure the workflow to execute when the gym membership enrollment form is submitted.
7. Add a Deluge script action to the workflow.
8. Use the invokeurl task to send a GET request to the Indian Postal PIN Code API.
9. Retrieve the API response and extract the District and State information.
10. Assign the retrieved values to the corresponding District and State fields, using their correct field link names.
11. Save the Deluge script and workflow after resolving any errors.
12. Open the application and submit a test gym membership record with a valid PIN code, such as 600001.
13. Verify the API integration by checking whether the correct postal information is retrieved and stored.

SCREENSHOT:

Created > Validations on form submission

PIN_Code_API_Integration 1 Action Enabled

Created > Successful form submission

Gym 1 Action Enabled

On_Enrollment_Submit_Workflow 1 Action Enabled

Result

Thus, an external REST API was integrated with the Gym Membership Management System in Zoho Creator using Deluge scripting. The integration demonstrates how district and state information can be retrieved from a member's PIN code and used in the Gym Membership Enrollment form.
